TREATMENT OF A GREEN POOL

We have products available to assist with clearing your pool so please send email or ring Enviro spa , Ph: 07 5309 5285 or 0434 010 346 (any time). We will return your call.

We have a great product available now which is Pool Sparkle, this is a one off dose product which clears cloudy pools. We have a algaecide available which can be used monthly to assist in preventing algae.

We can then give you the most economical method to clear your pool.

If using liquid peroxide, a 4 X the normal dose will clear pool.

SHOCKING WITH ENVIRO BOOSTER POWDER:

- Do not dose with Bioblu or Enviro Clarifier until pool is clear.
- Shock dose with 4 X your normal weekly dose of Enviro Booster Powder to burn out any algae.
- Test the booster level as per chart below:

	4	Shock dose level for clearing a cloudy, green or dirty pool.
<p>To treat a cloudy, green or dirty pool <u>add enough powder</u> to achieve the level 4 colour and maintain that colour until the water has cleared. Test pH daily and increase if required. A normal dose is 60 grams per 10,000 litres. TO TEST: Rinse out the test tube with pool water then fill the tube with pool water. Drop one test tablet into the tube and crush it with the flat end of a pencil. Shake the tube for a minute then after 2 minutes compare the resulting colour with the test chart.</p>		

- Each day check the booster level and if the level is NOT level 4 then increase Enviro Booster until level 4 is reached. This level MUST be maintained to clear the pool. (It may take 3 shock doses to clear pool).
- The next day check pH level as it will drop with the shock dose.
- Increase PH within the range of 7.2-7.8 .
- Enviro pH Raiser can be ordered or obtain pH raiser from local pool store.
- Enviro pH Raiser dose at a rate of 1kg per 10,000ltrs.

Filter should be run longer until the water is clear. Backwash or clean Cartridge filter once the pool is clear to prevent re infecting with algae.

Light brushing of walls, steps and sides is important.

Chlorine Method:

Alternate method of Shock using a super dose of liquid chlorine to clear out whatever is causing your problem. To super dose with chlorine simply dose the pool with liquid chlorine enough to get the free chlorine level up to 20 ppm. This may take about 2 litres of liquid chlorine per 10,000 litres.

After adding the chlorine keep the filter running. The chlorine will cause the pool water to change into various strange colours during the cleansing process and may also cause scum to develop on the surface. This is normal.

Continue to run the filter. Keep the chlorine level up to at least 10 ppm until the pool water becomes clear and blue. You must continue the chlorine treatment until the water is clear and there is no algae on the walls or floor.

Once the water is clear, allow the chlorine level to diminish to less than 1ppm before proceeding to dose with the Enviro System as directed.
