

**Chlorine-Free & Salt-Free Spa and Pool Products,  
that treat you as well as your pool and spa**

**TIPS for maximising the effectiveness of the Enviro System & Algae control.**

- Don't use chemicals other than exactly those recommended on our website.
- Don't cut down on dosing quantity.
- Don't leave debris, leaves or dust, to accumulate in pool or in the skimmer basket or pump basket.
- If running an automatic pool cleaner check it is operating correctly and not blocked with debris in diaphragm.
- Take immediate remedial action if an algae problem starts to appear.
- ( See directions on web, email or ring for advice on clearing a green pool or algae problems).

**Attend to maintenance regularly:**

- Brush walls, coping, floor and steps.
- Weekly vacuum if not using an auto pool cleaner.
- Sand Filter, the spider gasket can be worn allowing dirty water to by-pass the filter medium thus allowing dirty water back into pool, therefore the pool can remain cloudy.
- If sand is old, it can form channels which means dirty water can again pass through the filter and back to the pool. Manufacturers recommend sand should be changed approx every 5 years.
- Backwash filter regularly and long enough for the sight glass on the filter to show clear.
- Cartridge Filter, The element should be in good condition, not ripped or have any holes in fabric which will allow water to by-pass the filter. Check the relief valve in the bottom of the cartridge filter canister is not blocked, as this will prevent proper flow through the cartridge which causes the pressure relief valve to open, allowing dirty water to return into the pool.
- All of the above filter problems will cause pools to remain cloudy due to particles remaining in circulation rather than being collected in the filter.
- Always follow the directions on product labels and our website.
- To ensure correct information follow instructions, these directions have been carefully tested out over many years. If you follow them exactly you should not have any trouble. If you are unsure please contact us either through the website or telephone for accurate and free advice.

- **Remember the Enviro system is different to chlorine technology.**

**Information re Algae:**

Proper maintenance of pH will assist in prevention of algae.

Algae are extremely hardy little organisms and, in some cases the algae becomes so resistant to the normal sanitiser that treatment with an Algaecide is required.

We have a compatible algaecide ("algae inhibitor") available which can be used on a monthly basis using a small dose is inexpensive and much easier than treating a serious algae problem.
